

Business Feature Analysis Report

Auromind Platform — AI-Powered Business Assistant

[!NOTE] This is the markdown edition of the Business Feature Analysis Report. You can download the print-ready, formatted PDF version containing running headers, footers, and page numbers here: [Download PDF Report \(Business Feature Analysis Report.pdf\)](#)

1. Executive Summary

Auromind is a multi-tenant Software-as-a-Service (SaaS) platform designed to automate sales follow-ups, optimize customer support, and streamline operations using **governed AI agents**. By utilizing a governed AI architecture, Auromind separates itself from simple "wrapper" applications. All agent actions pass through a custom governance gatekeeper using the **Model Context Protocol (MCP)**, enforcing security, compliance, and budget policies before any external API operations are executed.

This report compiles a complete business feature inventory of the platform based on a thorough analysis of its database models, API routers, backend services, and user interfaces. It serves as a guide for sales, pricing, and product teams to evaluate the platform's commercial value, establish SaaS tiers, and assess engineering efforts.

Key findings include:

- **17 distinct business features** spanning AI, automations, communication channels, integrations, CRM, and admin consoles.
 - **Two partially implemented features** (PayU payment gateway and Promise Tracking) identified in the codebase to guide roadmap planning and prevent sales over-commitments.
 - A **prepaid conversation wallet model (WCC)** enabling granular monetization of WhatsApp and social channels, ensuring that variable messaging costs are billed back directly to tenants.
 - A **multi-model routing engine** supporting OpenAI, Claude, Gemini, and Groq with automatic failovers and token usage logging linked to workspace limits.
-

2. Complete Feature Inventory & Complexity Analysis

The table below outlines every feature discovered in the codebase, categorized by module, with its technical complexity, pricing impact, development effort, and status.

Feature Name	Category	Complexity	Pricing Impact	Estimated Effort	Implementation Status
AI Chatbot & Assistants	AI Capabilities	Advanced	High	8 - 12 Weeks	Fully Implemented

Feature Name	Category	Complexity	Pricing Impact	Estimated Effort	Implementation Status
RAG / Document Search	RAG & Knowledge	Advanced	High	10 - 14 Weeks	Fully Implemented
Guardrails & Safety (MCP)	AI Governance	Advanced	Medium	6 - 8 Weeks	Fully Implemented
AI Self-Learning Loop	AI Capabilities	Advanced	High	8 - 10 Weeks	Fully Implemented
Workflow Automation	Automations	Advanced	High	12 - 16 Weeks	Fully Implemented
Email Automation & Sync	Channels / Email	Advanced	High	8 - 10 Weeks	Partially Implemented (End-points disabled in router)
WhatsApp Automation	Channels	Intermediate	High	6 - 8 Weeks	Fully Implemented
Instagram Automation	Channels	Intermediate	High	6 - 8 Weeks	Fully Implemented
CRM & Lead Management	CRM & Sales	Intermediate	Medium	4 - 6 Weeks	Fully Implemented
Meeting Scheduler	CRM / Utilities	Intermediate	Medium	6 - 8 Weeks	Fully Implemented
WCC Wallet & Rate Cards	Billing / Channels	Intermediate	High	6 - 8 Weeks	Fully Implemented
Super Admin Console	Admin Tools	Intermediate	Medium	6 - 8 Weeks	Fully Implemented
User Impersonation	Security / Support	Intermediate	Low	2 - 3 Weeks	Fully Implemented
Workspace Credit Control	Billing	Intermediate	Medium	4 - 5 Weeks	Fully Implemented
Diagnostic & Repair Tools	Maintenance	Intermediate	Low	3 - 4 Weeks	Fully Implemented
PayU Gateway	Billing	Intermediate	Low	4 - 6 Weeks	Partially Implemented (Disabled in gateway)
Promise Tracker	CRM / Utilities	Advanced	Medium	8 - 10 Weeks	Partially Implemented (Frontend UI mock; backend

Feature Name	Category	Complexity	Pricing Impact	Estimated Effort	Implementation Status
					stub)

3. Core Capabilities Breakdown

□ AI Capabilities

- **Multi-Model Routing:** The platform features a dynamic LLM router that connects to OpenAI, Anthropic (Claude), Google Gemini, and Groq. If an API key is missing or a provider is offline, the router automatically cascades through available models (e.g., Sonnet -> GPT-4o-mini -> Gemini Flash -> Groq) to ensure 100% service availability.
- **RAG & Knowledge Base ('The Brain'):** Ingests PDFs, Word Documents, Excel sheets, CSV files, and text documents. It crawls external web URLs (stripping scripts and boilerplates) and uses Vision-Language Models (VLM) to analyze and index uploaded images (.png, .jpg, .webp). Text is chunked, embedded using `sentence-transformers`, and stored in `pgvector` for semantic search.
- **Governance & Safety (MCP):** A Model Context Protocol service evaluates query intent, rewrites queries for RAG lookup, routes queries to specialized tools (Vector DB, Web Search, Calculator, Casual Chat), and blocks prompt/code injections, jailbreaks, PII leakage, or unauthorized database access.
- **Self-Learning Loop:** A reinforcement learning engine tracks thumbs-up/down feedback and comments. It identifies tool failures and suggests keyword rewrite rules that can be promoted to system-wide governance policies.

⚙️ Automation Capabilities

- **Workflow Flow Builder:** Runs complex, multi-step asynchronous logic graphs. Flows utilize nodes like `send_msg`, `brain_query` (invoking sales or support agents), `ask_question` (pausing workflow execution until a customer replies), `assign_agent` (round-robin routing), `move_stage` (CRM updates), and `notification`.
- **Fuzzy Trigger Engine:** Parses incoming customer texts or interactive button values using exact, contains, word-subset, or fuzzy string comparisons to trigger specific automation flows.
- **Template Management:** Syncs Meta-approved marketing and utility templates (incorporating CTA buttons and media) with WhatsApp/Instagram channels.
- **Celery Schedulers:** Asynchronous workers coordinate periodic tasks, follow-up messages, credit audits, and calendar events.

□ Supported Communication Channels

- **Meta WhatsApp Cloud API:** Direct integration to deliver template messages, rich media,

and interactive quick-reply buttons.

- **Instagram Business Messaging:** Direct Direct Message (DM) and comment hook synchronization into the workspace inbox.
 - **Twilio WhatsApp API:** Alternative messaging integration equipped with status callbacks to monitor message delivery states.
 - **Email & Gmail Sync:** Gmail OAuth crawler to read primary emails, automatically draft suggested replies, and index threads in RAG (Routes defined but deactivated in API).
-

4. User and Admin Modules

Tenant Workspace Modules (User Console)

The workspace dashboard serves business founders and team agents:

- **Unified Inbox:** A single dashboard to monitor and manual-reply to chats on WhatsApp, Instagram, and Twilio. Includes toggles to hand off conversations between the AI agent and human operators.
- **Lead scoring CRM:** Displays lead lists with scores, tiers (Hot, Warm, Cold), and detailed factor breakdowns (urgency, budget signals, progress).
- **Brain Panel:** Interface to upload files, configure web crawlers, and manage indexed knowledge chunks.
- **Flow Canvas:** A workflow builder where workspace admins define triggers and sequence communication nodes.
- **Prepaid Wallet:** Interface to buy credit packs for AI usage and recharge the prepaid messaging wallet.

SaaS Platform Modules (Super Admin Console)

The global console manages platform operations across all tenants:

- **Workspace Directory:** Overview of tenant plans, active members, and custom API token caps.
 - **User Impersonation:** Admin tool generating temporary tokens to access any client's workspace for debugging and configuration support.
 - **WCC Billing & Rate Cards:** Interface to define WhatsApp message pricing based on category and region, ensuring profit margins over Meta's base costs.
 - **Billing Operations & Diagnostics:** Financial logs, manual transaction overrides, billing retry utilities, and automated database mismatch repair tools.
 - **Performance Monitor:** Systems graph highlighting API call volume, latency, error rates, and cache/database connection states.
-

5. Technical Stack

Auromind is built on a high-throughput, modern technology stack:

- **Frontend:** Next.js 14 (App Router) styled with Tailwind CSS, Framer Motion, and Lucide React.
 - **Backend:** FastAPI (Python 3.11+) implementing asynchronous endpoints, Pydantic V2 schemas, and JWT session handling.
 - **Database:** PostgreSQL utilizing pgvector for semantic search index storage.
 - **ORM:** SQLAlchemy 2.0 (Async) + Alembic for migrations.
 - **Queue/Cache:** Redis for temporary state cache + Celery for background scheduling.
 - **Integrations:** Razorpay & PayU SDKs (billing), Meta Graph SDK, Twilio REST API, and Google API Client (OAuth, Gmail, Calendar).
-

6. Suggested SaaS Pricing Tiers

To maximize customer lifetime value (LTV) and cover variable API and Meta costs, the following three tiers are recommended:

1. Basic Plan — \$49 / Month

Ideal for solopreneurs, local shops, and startup validation.

- **Entitlements:** 2 Team Members | 1 Workspace | 5,000 AI Credits/Month | 5 Knowledge Base Documents (500MB storage) | 2 Automation Flows (5 nodes max) | 1 Messaging Channel.
- **Usage Billing:** No credit rollover. \$5 starting prepaid messaging wallet included. Standard models only.

2. Pro Plan — \$149 / Month

Recommended for growing SMBs with active sales and support teams.

- **Entitlements:** 10 Team Members | 3 Workspaces | 25,000 AI Credits/Month | 20 Knowledge Base Documents (2GB storage) | 10 Automation Flows (20 nodes max) | Unlimited messaging channels.
- **Included Features:** CRM Lead Scoring, Google Calendar OAuth Sync, Custom LLM selection (Claude/OpenAI), Credit rollover.
- **Usage Billing:** \$20 starting prepaid messaging wallet included.

3. Enterprise Plan — \$499+ / Month (Custom Contract)

For large organizations requiring custom limits and dedicated resources.

- **Entitlements:** Unlimited Team Members & Workspaces | Custom AI Credit Allocation | Custom storage & document limits.

- **Included Features:** Advanced RAG Analytics & Reinforcement Learning, custom database instances, Promise Tracking (once finalized), dedicated support manager, and 99.9% uptime SLA.

[!IMPORTANT] **Premium Justifications:** features like custom LLM config routing, automated reinforcement loops, VLM image analysis, and the prepaid WCC wallet should be restricted to Pro/Enterprise plans. The prepaid wallet, in particular, is critical to cover region-specific Meta WhatsApp charges without eroding SaaS margins.

7. Next Steps & Product Recommendations

1. Resolve Partially Implemented Features:

- **Gmail Sync:** Enable Gmail API endpoints in `gmail.py` router so that users can sync their inbox directly from the dashboard.
- **Promise Tracking:** Integrate an LLM extraction prompt in `orchestration_service.py` to identify commitments from chats and save them to a new database entity (**Promise**), linking it to the frontend dashboard.
- **PayU Gateway:** Resolve signature and webhook handlers in `payu.py` if a secondary gateway is required for localized markets.

2. Promote Premium Tiers:

Target SMBs on the Pro Plan by demonstrating the automatic lead-tiering and calendar booking workflows, which deliver clear, immediate ROI.

3. Monitor WCC Rate Cards:

Frequently synchronize Super Admin rate cards with Meta's official country-level pricing adjustments to ensure billing markups remain accurate and profitable.
